A. Why Cubic Plateau Beats Linear & Log Potentials
Zone C
(Hop 1)
Zone B
(Hop 2)
Zone A
(Hop 3)
Normalized Spectral Potential Φ(d)
Causal Lookback Distance d = i - j (Tokens)
Linear Tilt (Φ = d/T) — Starves Zones B & C
Concave Log (Φ = ln(1+d)/ln(1+T)) — Boosts Decoys 80-93%
Cubic Plateau (c=0.54, p=3) — Iso-Potential Roof
Barrier-3 Adversarial Decoy Zone (16 Decoys)
B. Dual-State Symmetric Decoy Subtraction (Active Notch Filter)
Attention Probability Allocation (%)
Baseline S_base (Decoy Dominated)
Heavy-Gravity S_heavy (Decoy Matched Filter)
Superconducting S_Super = norm((1+η)S_free - ηS_heavy)
Local Syntax
(d ≤ 32)
Late Decoys
(VAULT-OMEGA)
